

WWSEC 2013

Opportunities for Energy Efficiency Gains at WPCF

Bob Sprick City of Eugene (541) 682-8617

Energy Management

Energy Management Group

Defining Energy Costs

Energy Conservation Measures (ECM)

Ways to Manage Energy Costs

Basic Question: If it uses energy what is the control measure? Best Practice?

Energy Management Group

- Upper Management Support
- Biggest Users – Operations Off/On
- Process Control
- Maintenance – PM
- Purchasing- Spec for premium efficiency & Energy Life Cost component
- Design review team & Equip. Replacement
- Service Provider
- Everybody is a player

Defining Energy Costs

- Kilowatts (KW) = Watts/1000
- Kilowatt Hours (KWH) = KW X hours of operation
- Demand = highest KW for 15 minute period during billing period
- Power Factor= PF or KVAR

Kilowatts

Kilowatt Hour

+

on for 1 hour = 1 KWH

Demand KW

- Usually the highest KW usage over 15 minutes during the billing period
- Read your power rate schedule /contract
- Demand is not easily stored. Generated as needed.
- Cost is highest rate ~\$ 6.65 / KW
- KWH cost accumulates \$0.0427 - \$0.08 per KWH

Power Factor

Check your bill

If you see PF or KVAR charges, contact your service provider for help.

Power factor charge is money spent for no usable energy.

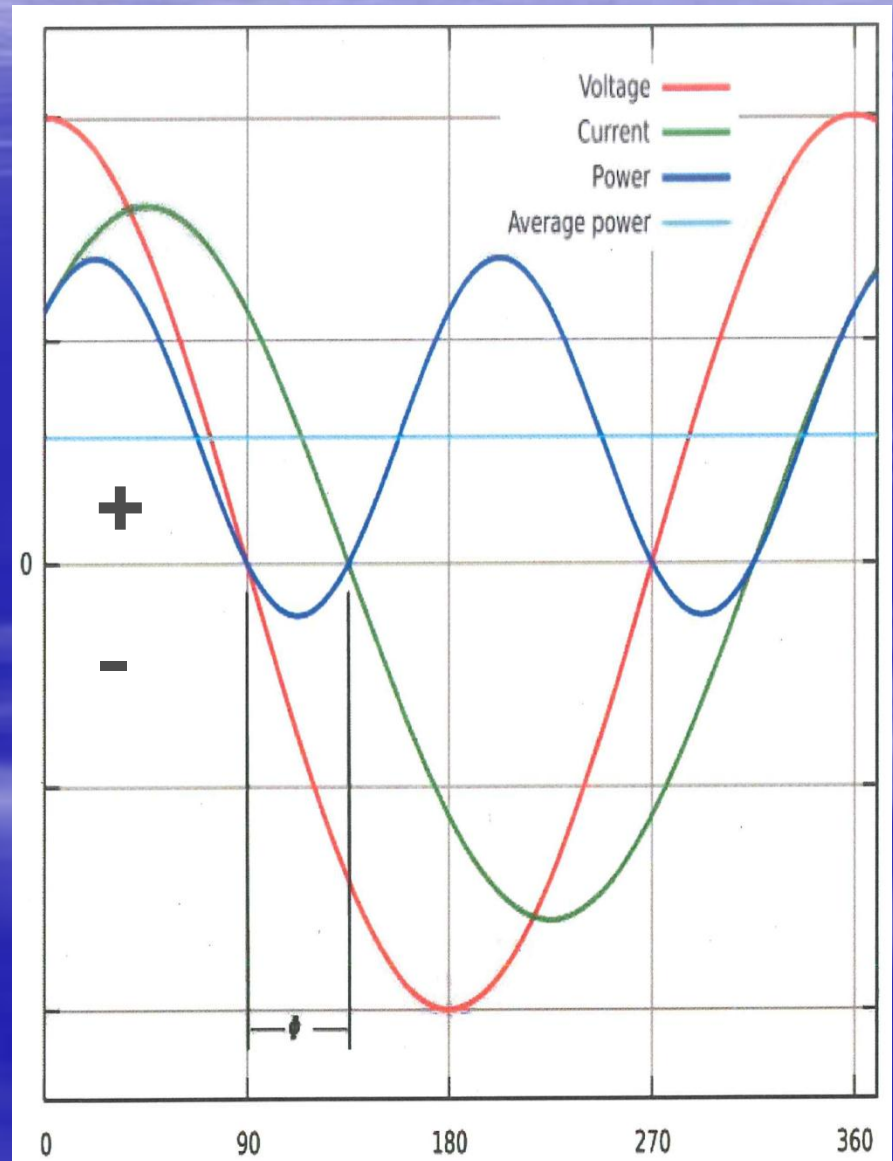

Pure Resistive Power

$$P = I * E$$

Inductive Power

Power Factor

Active Power ($V \times A \times PF$) = KW

Reducing load to 50% increases PF problem

Fixing Power Factor

First check existing capacitors

Load Factor (LF)

- $LF = \frac{\text{KWH (billing period)}}{\text{KW} \times 24 \times \text{days in billing period}} \times 100$
- ✓ Below 55% = oversized equipment
Evaluate cause - Storm event other?
- 70% and above is pretty good for WWTP
- Pump-stations KWH/Run Time
- Flow then track KWH/MG

Benchmark

Energy Consumption

1000	746	\$4,662.50	24	17904	\$755.55	\$22,666	\$27,329	\$327,948

Time of Use Billing Chart

If you have an on-peak / off-peak rate structure track power use percentage

Plan for Off- Peak Hours

- Look at your diurnal load and see what activities can be shifted
- Waste Thickening
- Thickened sludge pumping
- Tank draining
- Clean-up – flushing
- recycle water- irrigation
- Surge basin, back up influent
- Generation – gas storage- maintenance work

Energy Management

- Information on billing costs, check your bill
- Talk to power provider, identify best rate schedule, incentive funding, problem solving, audit programs
- Identify where energy is going-collect data- suitcase
- Ask what if questions about each piece of equipment
- Bring help from outside for expertise
- Make burgers out of sacred cows (change the way of doing)
- Find an Energy Champion(s)
- Invest in a management system
- Think private
- Just DO It, implement

Finding Energy Conservation Measures

- (ECM that effects WW treatment quality may not be well received “Risk Mgt.”)
- Is the power necessary? (Turn lights out, heat down, Hot water set points)
- Can the on time be changed and task will still be accomplished? (Is there a load shift to off peak demand opportunity here?)
- Is the size appropriate? Over sizing is the name of the game. Measure actual power required - Bio fans
- Is the load variable? (Timer, Frequency drive)
- Does a change require human interface? Increase labor cost, training, behavior management

ECM that require a human interface to achieve requires training until you get it right.

Don't just act- communicate

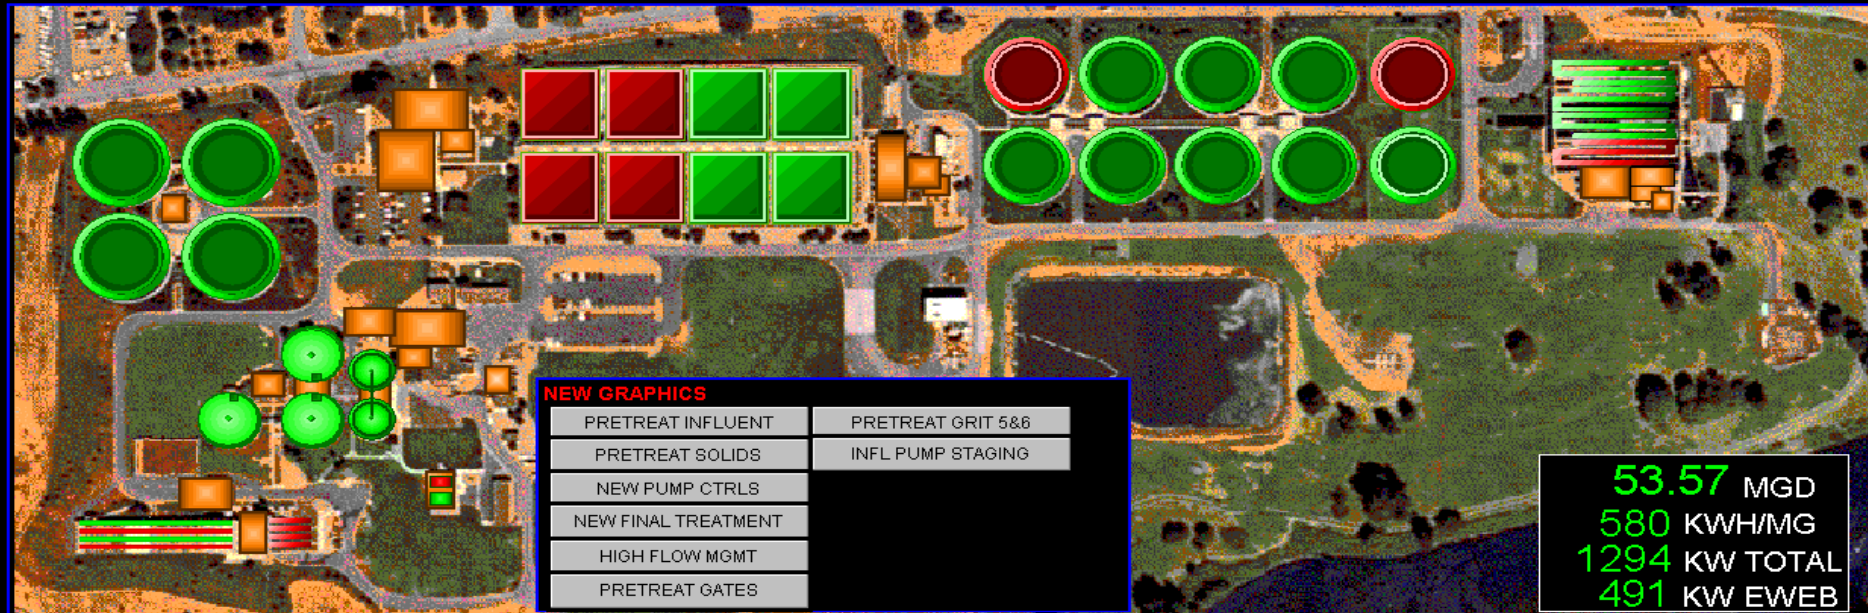

Keep looking for a better best practice:

Design Review

/ Equipment Replacement

- Clear expectations/specifications
- Outside review

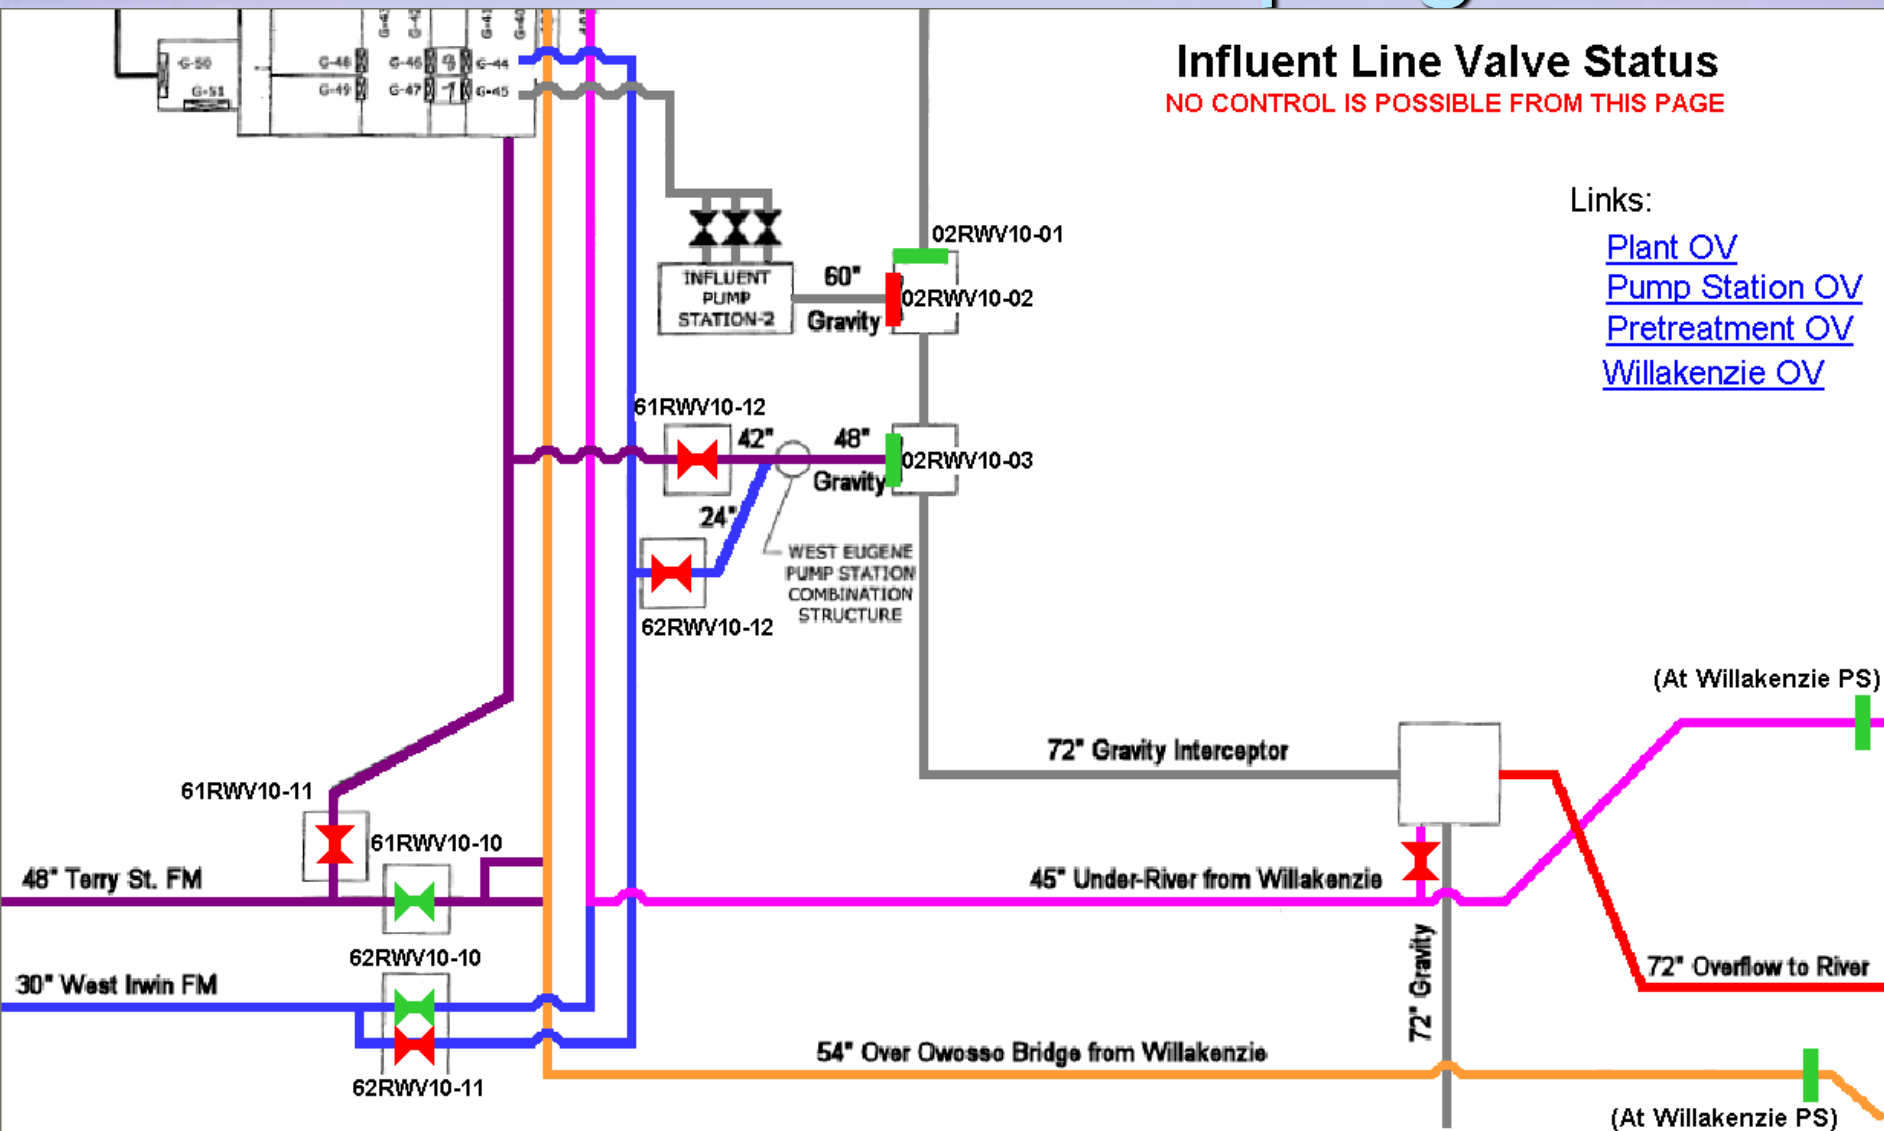

Think out of the box

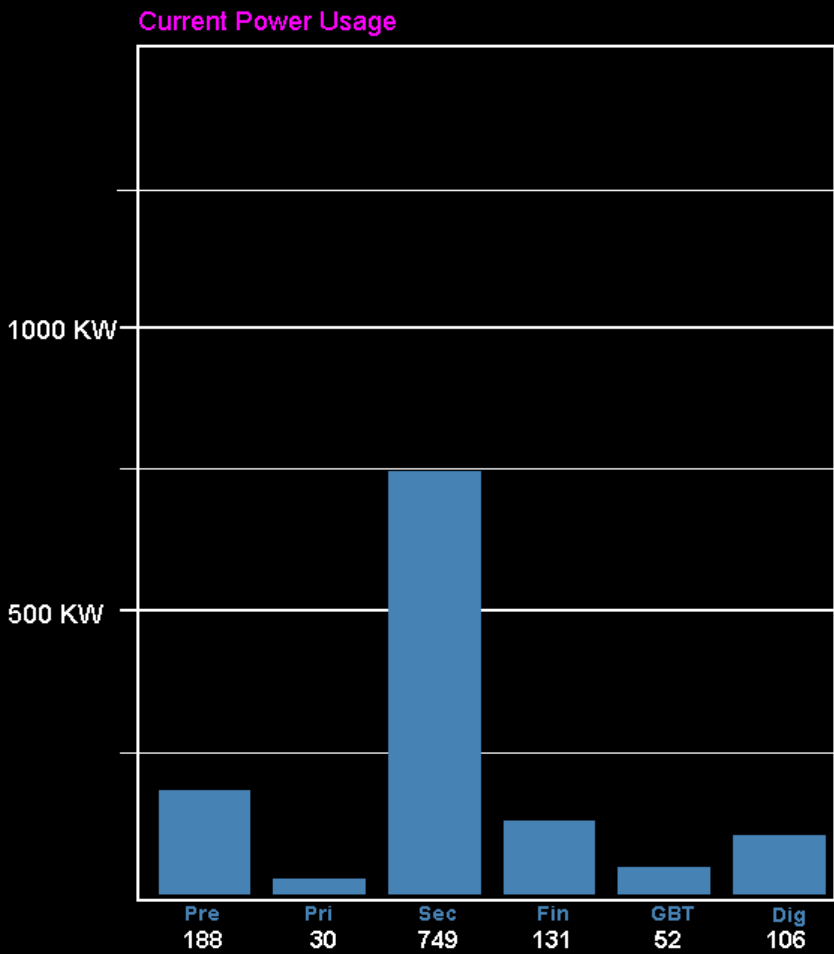

- Many ECM require a design change- be proactive
- Get design engineer to explain over design criteria used?
- Is equipment choice correct? i.e. Do pumps down stream of fine screens or grinders need to be open face impellers?
- Apply payback policy guidelines

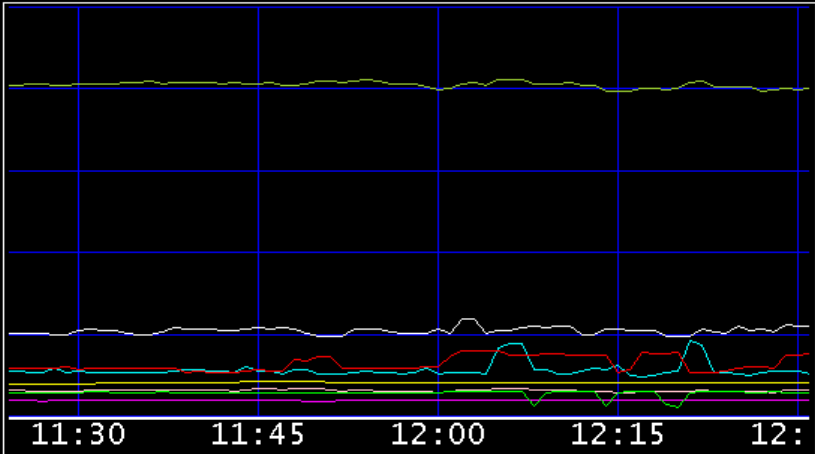

Redundant Pumping

Plant Power Usage

Annual 746,250 KWH

Energy Conservation Measures

- Audit reclaim water usage.
- lower volume & pressure
- Timers on sprays
- easy adjustment >>>>>>>>>>>>>>>>>>>
- booster pumps to increase psi where needed
- use nozzles, not open hose
- ask why it is on- adjust for need
- excessive cooling water
- increase pressure to do the work and turn back down when finished

Seal Water 10PSI
over discharge pressure
Electric solenoid

Changing final chemicals:
Reduced reclaim water usage for
injectors saves 85,000 KWH and
\$5,270 annually. \$13K incentive

Grit cyclone overflow water used to operate screening sluice.

Reduces W2 use 20-25 HP or \$7,000/year

Aeration

- Automate D.O. control (25-40% savings)
- Lower header discharge pressure. We save 50KW per psi. (\$20,000 per year)
- Clip blower maximum output
- Clean intake filters
- For centrifugal blowers, use inlet valve to throttle.
- Positive displacement, VFD, sheaves, timers
- Switch to smaller blower during low demand-Timers
- Mechanical – depth, timer, speed
- Motors < 25 HP turn down 66% load, > 25 HP 50%
- Fine bubble diffusers (save 50% or more)

Power Requirements as function of MLSS Dissolved Oxygen

Power Required For Nitrification

Oxidizing NH₃ can result in a 60% increase in aeration power

No ammonia limit- shut blower off a couple of hours each day- 8% savings

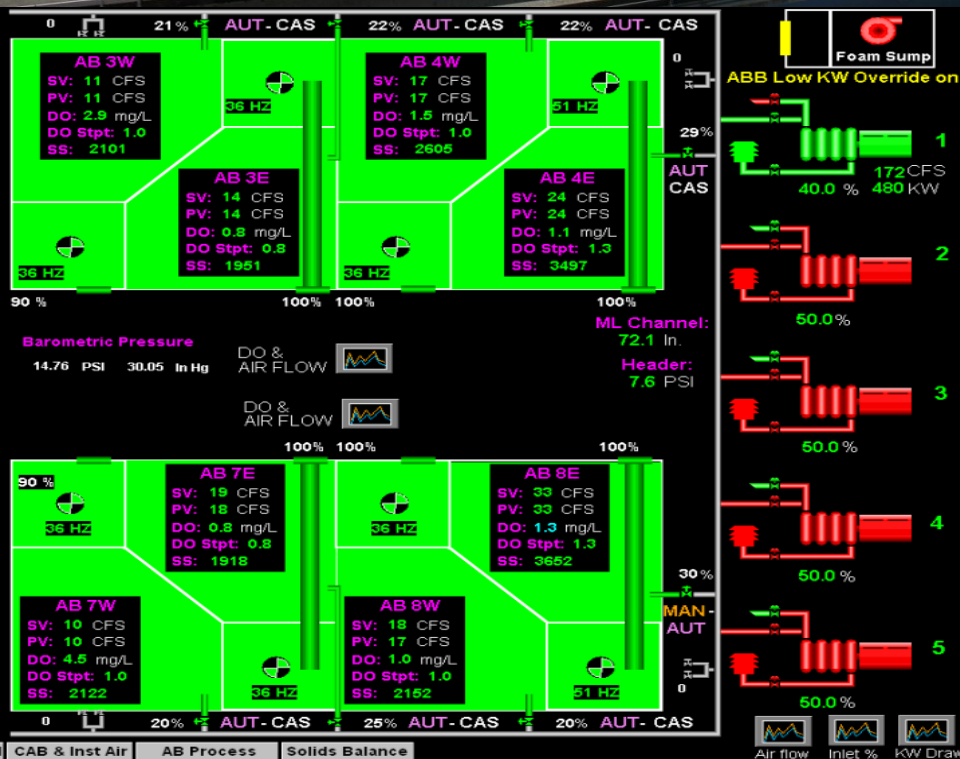

Nitrifiers are strict aerobes

Chlorine demand 5:1

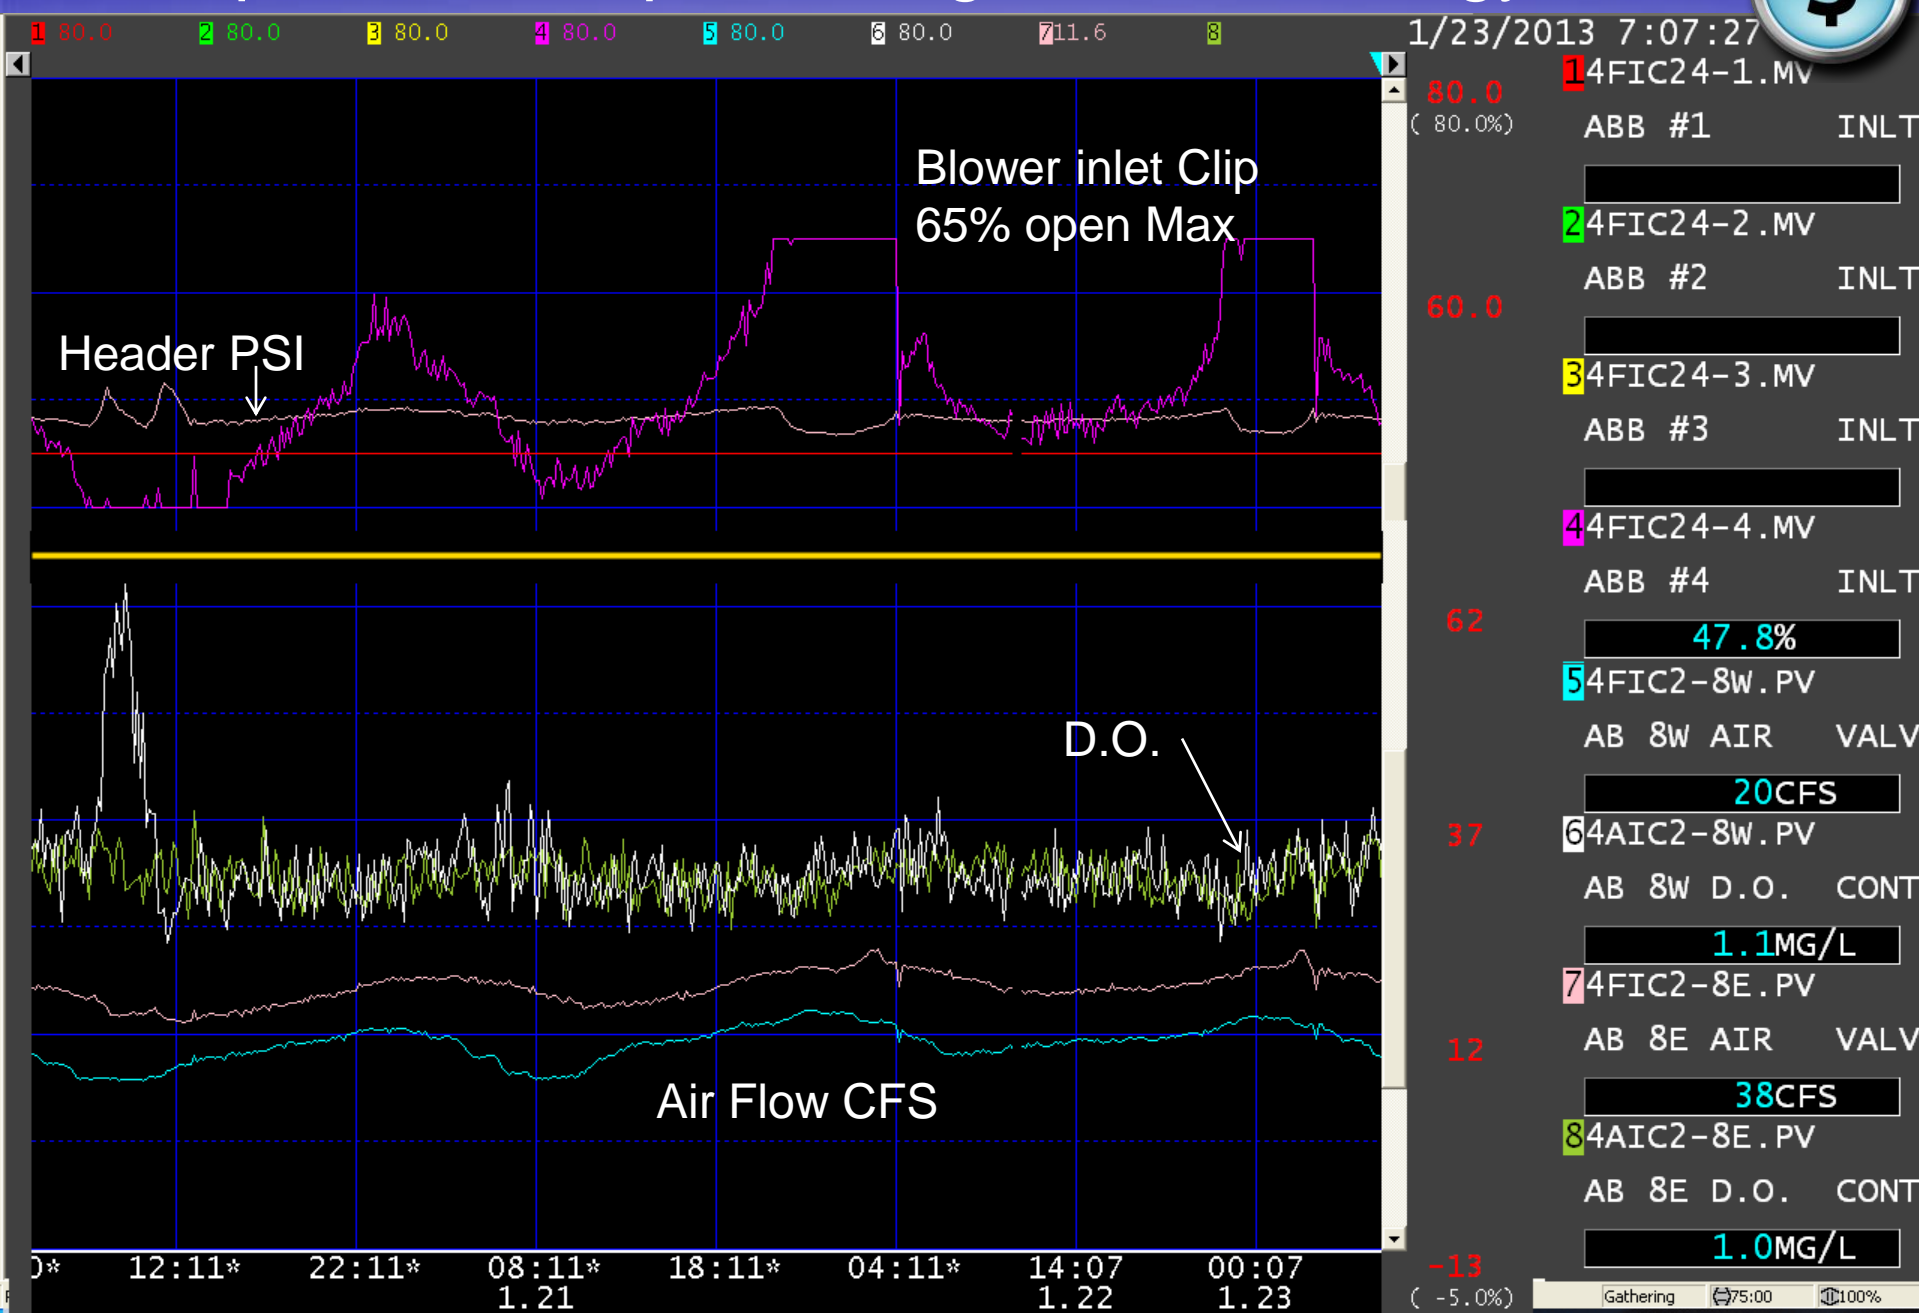

DO Concentration in relation to SRT

Clip blower output settings to save energy

Diffuser Cleaning Improves transfer efficiency 10-40%

Aeration zones with higher F/M foul faster

Timers to adjust run time not only saves power but can be an even bigger savings for maintenance.

50 Pump Stations ECM Opportunity

Pumping

- PM pumps/ motors- excessive dirt, alignment, bearing play, motor temp, vibration, seal water, voltage 3.5% diff between legs = 25% temp increase
- Flush Lines (we see 53% savings) (320 gpm to 490 gpm)
- Pump control- Variable speed, timers, start stop points, stager for demand savings (grit pump/collector)
- Determine which pump on a header is most efficient- use it as lead
- Pump Station: KWH/Run Time (station as a whole and individual pumps)

Horsepower = (Ft of head X GPM) ÷ (3960 X Efficiency)

HP for 1 mgd anoxic recycle pump = $(5' \times 694) \div (3960 \times .90) = .97 \text{ HP}$

Summary

- Good operations is energy conscious everyday
- Energy use is a human behavior problem
(Success is an exercise in human relations)
- As supply decreases, the cost will rise
- “What About Bob” - Richard Dreyfuss & Bill Murray
Baby Steps, Baby Steps
- Every Watt, every therm, counts
- Best ECMs 1. Engineered 2. Automated 3. Human interface
- Just Do It ! , Implement, implement, implement

What do we do with all the energy saved?

Store power in an electrolyte cell under the base of our signal tower

On July 4th we discharge the savings back to mother earth
